

of leakages and faults in the brickwork setting—in other words to know how far the furnace approximates to its task of converting the carbon completely into carbon dioxide without

dissipating its heat on excess air.

In the "Sarco" recorder, fig. 2, supplied by the Sarco Engineering & Trading Co., Ltd.,

connection is made with the flue by a 1-in. pipe from which a 1/2-in. tube leads to the instrument, and to ensure rapid movement of the gases a return tube connects the recorder with the base

of the chimney, or other convenient outlet. Analyses are completed and the results recorded at the rate of 20 to 30 per hour with an accuracy well within 1 per cent of the carbon dioxide actually present in the gas.

The S. A. W. patent recorder (fig. 3), manufactured by Alexander Wright & Co., Ltd., of Westminster, consists of a gas-extracting chamber into which a large

sample  
of gas is  
drawn from  
the flues by  
a  
water  
injector.  
From this a  
smaller  
measured  
sample is  
removed  
and  
delivered to  
the potash  
container,  
and a small  
gasholder  
with rising  
bell  
carrying a  
graduated  
scale on  
top receives  
the gas,  
after  
removal  
of the  
carbon  
dioxide, and  
records  
its volume.  
This is  
simultaneou  
sly  
indicated  
on a  
rotating  
chart for  
permanent  
reference,  
and deter-  
minations  
are  
completed  
in about  
three

minutes.

" Arkon "  
combustion  
recorders  
are placed  
on the  
market by  
Walker,  
Crosweller,  
& Co.,  
London, in  
several forms. Model F is water-driven,  
but, where there is difficulty

in arranging water-supply or outlet, model G may be substituted in which a  $\frac{1}{2}$ -h.p. electric motor is employed to draw the gas samples to the recorder and to pass them through the analysis. This type is found suitable for power stations and engine-rooms where wiring is easy but water service sometimes difficult. Fig. 4 shows the method of working of the water-driven model. Water falling into tank 10 and passing out by .13 maintains a constant level. The tube n is perforated inside the tank 10 so that water enters it and, falling down, draws the sample through gas burette i, which is connected with the flue. A second stream of water falls through
